

Handson 1st Module - Automation Strategy Document

Purpose

This document defines which Hands-on 1st Module test cases should be automated and which should remain manual based on the ROI classification, execution characteristics, workflow stability, data-driven behavior, and business complexity provided in the source workbook.

Automation Objectives

Prioritize high-ROI and mid-ROI scenarios for automation where the workbook identifies critical paths, high-volume/data-driven functionality, stable UI workflows, or critical notification workflows.

Automation Selection Criteria

- Auto (High ROI) scenarios identified in the source workbook.
- Auto (Mid ROI) scenarios with stable UI workflows or data-driven behavior.
- Critical paths and critical notification workflows.
- High-volume functionality where reusable, repeatable coverage is beneficial.

Manual Selection Criteria

- Scenarios explicitly classified as Manual.
- Manual assessment requirements.
- Complex business logic requiring manual assessment.

Automation Decision Matrix

Case ID	Title	Recommendation	Priority	Business Justification
TC01	User Login	Automate	High	Critical path and Stable UI
TC02	Search owner name and select it	Automate	High	High volume search functionality , data driven
TC03	Select Multiple choice question option from settings	Automate	High	High, data driven
TC04	Create new MCQ with required fields	Automate	High	High, data driven
TC05	Select community selector	Automate	High	High, data driven
TC06	Select radio button for any MCQ and Click Edit button	Automate	High	Stable UI workflow
TC07	Select radio button for any MCQ and Click duplicate button	Automate	Medium	Stable UI workflow
TC08	Select radio button for any MCQ and Click Archived button	Automate	Medium	Stable UI workflow
TC09	Search created MCQ	Automate	Medium	High, data driven
TC10	MCQ's list view	Automate	High	High, data driven

Case ID	Title	Recommendation	Priority	Business Justification
TC11	Active and Inactive toggle option	Automate	High	High, data driven
TC12	Click Filter button	Automate	High	UI workflow
TC13	Sending email notification	Automate	High	Critical notification workflow
TC14	Create Alerts	Manual	Low	Manual assessment
TC15	Click View reports icon from list view	Automate	Medium	Stable UI workflow
TC16	Inheritance – Based on Regions, communities and Owner	Manual	Low	Complex business logic,Manual assessment
TC17	MCQ visibility by visitor type	Manual	Low	Manual assessment

Detailed Justification

TC01 - User Login

Recommendation: Automate

Business Justification: Critical path and Stable UI.

Why automate:

- Covers a critical application path.
- The UI workflow is identified as stable, supporting repeatable automation.

Automation Layer: API/UI

TC02 - Search owner name and select it

Recommendation: Automate

Business Justification: High volume search functionality , data driven.

Why automate:

- High-volume functionality makes automation valuable for repeated execution.
- Data-driven behavior supports reusable test data and repeatable coverage.

Automation Layer: API/UI

TC03 - Select Multiple choice question option from settings

Recommendation: Automate

Business Justification: High, data driven.

Why automate:

- Data-driven behavior supports reusable test data and repeatable coverage.

Automation Layer: API/UI

TC04 - Create new MCQ with required fields

Recommendation: Automate

Business Justification: High, data driven.

Why automate:

- Data-driven behavior supports reusable test data and repeatable coverage.

Automation Layer: API/UI

TC05 - Select community selector

Recommendation: Automate

Business Justification: High, data driven.

Why automate:

- Data-driven behavior supports reusable test data and repeatable coverage.

Automation Layer: API/UI

TC06 - Select radio button for any MCQ and Click Edit button

Recommendation: Automate

Business Justification: Stable UI workflow.

Why automate:

- The UI workflow is identified as stable, supporting repeatable automation.
- The workflow is stable and suitable for consistent UI validation.
- The scenario represents a defined UI workflow that can be validated consistently.

Automation Layer: UI

TC07 - Select radio button for any MCQ and Click duplicate button

Recommendation: Automate

Business Justification: Stable UI workflow.

Why automate:

- The UI workflow is identified as stable, supporting repeatable automation.
- The workflow is stable and suitable for consistent UI validation.
- The scenario represents a defined UI workflow that can be validated consistently.

Automation Layer: UI

TC08 - Select radio button for any MCQ and Click Archived button

Recommendation: Automate

Business Justification: Stable UI workflow.

Why automate:

- The UI workflow is identified as stable, supporting repeatable automation.
- The workflow is stable and suitable for consistent UI validation.
- The scenario represents a defined UI workflow that can be validated consistently.

Automation Layer: API/UI

TC09 - Search created MCQ

Recommendation: Automate

Business Justification: High, data driven.

Why automate:

- Data-driven behavior supports reusable test data and repeatable coverage.

Automation Layer: API/UI

TC10 - MCQ's list view

Recommendation: Automate

Business Justification: High, data driven.

Why automate:

- Data-driven behavior supports reusable test data and repeatable coverage.

Automation Layer: API/UI

TC11 - Active and Inactive toggle option

Recommendation: Automate

Business Justification: High, data driven.

Why automate:

- Data-driven behavior supports reusable test data and repeatable coverage.

Automation Layer: API/UI

TC12 - Click Filter button

Recommendation: Automate

Business Justification: UI workflow.

Why automate:

- The scenario represents a defined UI workflow that can be validated consistently.

Automation Layer: UI

TC13 - Sending email notification

Recommendation: Automate

Business Justification: Critical notification workflow.

Why automate:

- The scenario covers a critical notification workflow and is therefore a high-ROI automation candidate.

Automation Layer: API

TC14 - Create Alerts

Recommendation: Manual

Business Justification: Manual assessment.

Why keep manual:

- The source workbook explicitly identifies this scenario for manual assessment.
- Manual validation is retained because the scenario is not classified as an automation candidate.

Automation Layer: N/A

TC15 - Click View reports icon from list view

Recommendation: Automate

Business Justification: Stable UI workflow.

Why automate:

- The UI workflow is identified as stable, supporting repeatable automation.
- The workflow is stable and suitable for consistent UI validation.
- The scenario represents a defined UI workflow that can be validated consistently.

Automation Layer: API/UI

TC16 - Inheritance – Based on Regions, communities and Owner

Recommendation: Manual

Business Justification: Complex business logic, Manual assessment.

Why keep manual:

- The source workbook explicitly identifies this scenario for manual assessment.
- Manual validation is retained because the scenario is not classified as an automation candidate.

The workbook specifically identifies complex business logic as a reason for manual assessment.

Automation Layer: N/A

TC17 - MCQ visibility by visitor type

Recommendation: Manual

Business Justification: Manual assessment.

Why keep manual:

- The source workbook explicitly identifies this scenario for manual assessment.
- Manual validation is retained because the scenario is not classified as an automation candidate.

Automation Layer: N/A

Automation Pyramid Recommendation

API/UI: Most automated scenarios are identified as API/UI in the source workbook.

UI: Stable UI workflows such as edit, duplicate, archive, and filter are assigned to the UI layer.

API: Sending email notification is assigned to the API layer.

N/A: Manual scenarios are assigned N/A in the source workbook.

Conclusion

14 scenarios are recommended for automation and 3 scenarios should remain manual. The automation recommendations are directly based on the ROI categories and justifications in the source workbook. The manual scenarios are retained because they are explicitly marked for manual assessment, including the scenario where complex business logic is identified.
